An Inventory Decision support System to the Glass Manufacturing Industry - Nuno Órfão and Carlos Bispo

Summary

- 1. Problem framework
- 2. What kind of decisions?
- 3. Methodology
- 4. The glass manufacturing process
- 5. The IPA Approach
- 6. The SimulGLASS package
- 7. Numerical study example
- 8. Future developments
- 9. Conclusions

1. Problem framework

- Generalized Portuguese glass industry production strategy is a producing-to-order one;
- Managers are often confronted with decisions on whether or not to hold inventories;
- Some lack of suitable inventory decision support systems;

2. What kind of decisions?

 For a production process, and for a given production strategy (make-to-stock, maketo-order, ...) we decide on...

i) the base-stock levels that minimizethe total cost

ii) the corresponding **service level**

• Compare the **performance** of alternative production strategies

3. Methodology

- i) Process data analysis
- ii) Literature review
- iii) Model definition
- iv) Software development
- v) The testing stage
- vi) Numerical study
- vii) Analysis of results

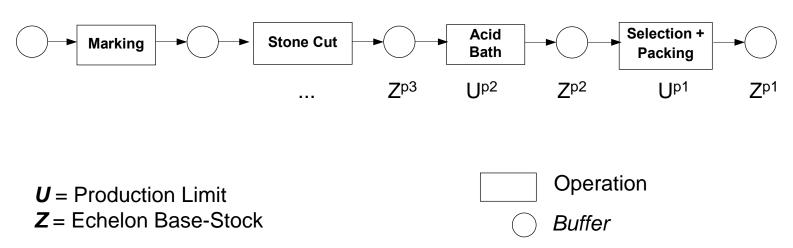

4. The Glass Manufacturing Process

Hot-area:

Cold-area:

5. Model Definition

- Multiple machines in series with finite capacity
- Multi-products
- Lot Splitting
- Random Yield
- Random Demand
- Production decisions based on a weighted shortfall heuristic

6. The Infinitesimal Perturbation Analysis (IPA) Approach

- Tool used on complex systems to compute
 Grad J (in order to the control parameters);
- Classical approach:

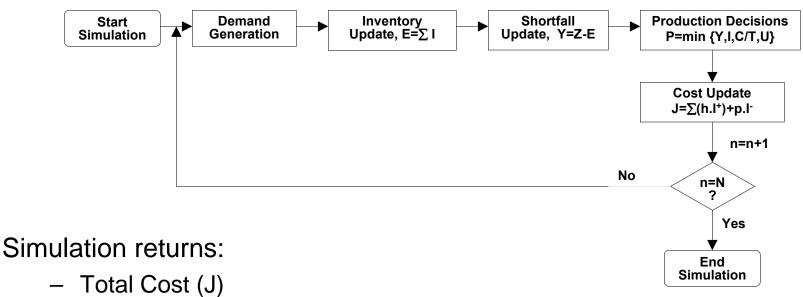

M parameters \Rightarrow M+1 Simulations

• IPA approach:

M parameters \Rightarrow 1 Simulation

7.1 Software Package - Simulator

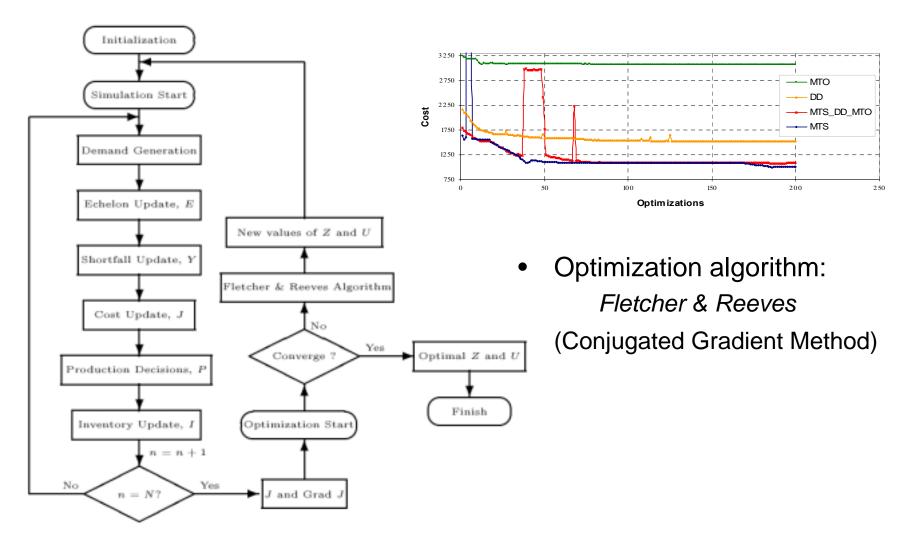

Cost Cradient (Crad

$$J_{n}^{p} = \sum_{s=2}^{s} \left[(I_{n}^{ps})^{+} h^{ps} \right] + (I_{n}^{p1})^{+} h^{p1} + (I_{n}^{p1})^{-} b^{p} + \sum_{s=1}^{s} (1 - \alpha^{ps}) (h^{ps} - m^{p}) P^{ps}$$

7.2 Software Package - Optimizer

7.3 Software Package - Output

- **Minimum cost** for the simulated strategy;
- Optimal base-stock levels for all products at all stages;
- Optimal Production limits for all products at all stages;
- Average lead-time for all products;
- Corresponding service level;
- Internal Costs (In-house costs);

7.3 Software Package – User interfaces

7.4 Software Package - Tests

- Derivative accuracy $\frac{\partial J}{\partial Z} = \frac{J_{perturbed} J_{nominal}}{\epsilon}$
- Function cuts along gradient direction
- Control of state and decision variables (Inventory ≥ 0, Production ≥ 0, ...)

8.1 Numerical Study Example - Data

- Process Parameters
 - 27 Products (Pareto's Law)
 - High demand level (80%)
 - Medium demand level (15%)
 - Low demand level (5%)
 - 9 Machines (stages) and random yield
 - 4 production shifts/day
 - 4 Production strategies: MTS, MTO, DD and M/D/M

8.2 Numerical Study Example - Results

| Production Strategy | Optimal Cost | Confid. Interval | In-house Cost |
|------------------------|-----------------|---------------------|------------------|
| MTO | 3079,6 | ±1,9 % | 488,6 |
| DD | 1529,4 | ± 0,7 % | 540,4 |
| M/D/M | 1075,8 | ±0,8 % | 595,2 |
| MTS | 999,1 | ±1,4 % | 631,5 |

• Costs:

[m.u.]

| | STRATEGY | МТО | DD | M/D/M | MTS | | |
|-------------|--------------|---------------------|------|-------|------|--|--|
| | Demand Level | Lead-times [shifts] | | | | | |
| _ead-times: | High | 7,21 | 2,71 | 1,24 | 2,73 | | |
| _eau-times. | Medium | 6,66 | 2,67 | 2,61 | 1,17 | | |
| | Low | 4,67 | 2,74 | 4,87 | 0,73 | | |
| | All products | 6,18 | 2,71 | 2,91 | 1,54 | | |

9.1 Conclusions

- Development of an efficient tool to support production management teams;
- Evaluation of alternative production strategies;
- IPA provides rapid identification of good solutions;

9.2 Future developments

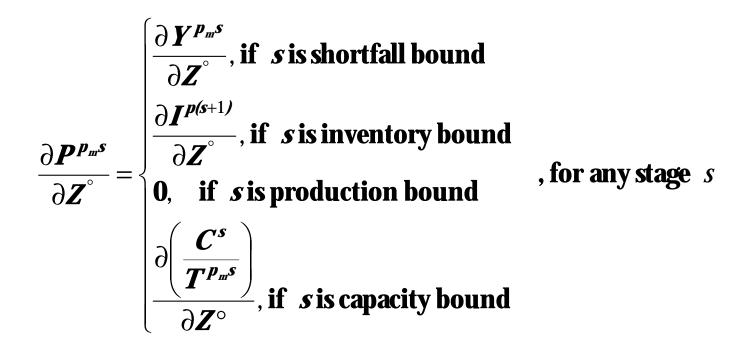

- Use firm data base to update process parameters (processing times, yield rates, ...)
- Development of more complex model (with random capacity and processing times);
- Dealing with random yield

• Alternative optimization algorithms (*Broyden-Fletcher-Goldfarb-Shanno*, ...);

A.1 Production Decisions

$$\boldsymbol{P}^{\boldsymbol{p}_{m}\boldsymbol{s}} = \min\left\{\boldsymbol{Y}^{\boldsymbol{p}_{m}\boldsymbol{s}}, \frac{\boldsymbol{C}^{\boldsymbol{s}}}{\boldsymbol{T}^{\boldsymbol{p}_{m}\boldsymbol{s}}}, \boldsymbol{I}^{\boldsymbol{p}(\boldsymbol{s}+1)}, \boldsymbol{U}^{\boldsymbol{p}_{m}\boldsymbol{s}}\right\}, \text{ for stage } \boldsymbol{s}$$

A.2 Performance Measure - Cost

$$J_{n}^{p} = \sum_{s=2}^{S} \left[(I_{n}^{ps})^{+} h^{ps} \right] + (I_{n}^{p1})^{+} h^{p1} + (I_{n}^{p1})^{-} b^{p} + \sum_{s=1}^{S} (1 - \alpha^{ps}) (h^{ps} - m^{p}) P^{ps}$$

$$\frac{\partial J_n^p}{\partial Z^{\circ}} = \sum_{s=2}^{s} \frac{\partial (I_n^{ps})^+}{\partial Z^{\circ}} h^{ps} + 1 \{I_n^{p1} > 0\} \frac{\partial (I_n^{p1})^+}{\partial Z^{\circ}} h^{p1} - 1 \{I_n^{p1} < 0\} \frac{\partial (I_n^{p1})^-}{\partial Z^{\circ}} h^p + \sum_{s=1}^{s} (1 - \alpha^{ps}) (h^{ps} - m^p) \frac{\partial P_n^{ps}}{\partial Z^{\circ}}$$

A.3 IPA Validation

Validation procedure consists in show that:

- All variables are diferentiable;
- Define their values;
- *Expected Value* and Diferentiation are permutable operatores;

A.4 Optimality Condition

• The optimal base-stock levels, **Z**, for the performance measure COST and for any production strategy are such that the following relation holds:

$$Pr(D_n^p \le I^{p_1}) = \frac{b^p}{b^p + h^{p_1}}$$

• Once the **SERVICE LEVEL** is defined, the estimation of the penalty costs becomes a simple task.

A.5 (s,S) Policy definition
